Weeks shown: Last week This week

Week span | 01/02/2021-07/02/2021 08/02/2021-14/02/2021

Notes:

Indicators 1-3 (COVID-19 deaths): Deaths data are reported with a week's lag. Deaths reported last week will show in this week's data, and so on. Deaths by cause of death (weekly numbers and cumulative), for deaths that occurred up to 8 January 2021 but were registered up to 16 January 2021 by week.

Indicator 8 (weekly incidence per 100,000 population): This indicator is RAG rated: Maroon >250 cases per 100,000, Dark red 151 to 250 cases per 100,000, Red 51 to 150 cases per 100,000, Amber 25 to 50 per 100,000, Green <25 per 100,000 per 100,000.

Indicator 10 (60+ weekly incidence per 100,000 population): This indicator is RAG rated: Maroon >150 cases per 100,000, Dark red 101 to 150 cases per 100,000, Red 51 to 100 cases per 100,000, Amber 25 to 50 per 100,000, Green <25 per 100,000.

Indicator 18 (Percentage of individuals who tested positive): This indicator is RAG rated Red >7.5%, Amber 4% to 7.5%, Green <4%.

Indicators 15-16: These indicators are still using PHE's old methodology for test deduplication where tests for individuals are deduplicated across the whole pandemic period. Anyone who has already received a test since the start of the pandemic will not be included in these weekly figures. These figures will underestimate the numbers of individuals tested.

Indicators 8-10, 17-18: These indicators are using PHE's adjusted approach to testing metrics. Individuals with a positive test are deduplicated across the pandemic. Individuals with a negative test are deduplicated across the preceding 7 days, to exclude repeat negative tests arising from recent multiple testing.

Indicator 21 (R number for London): The estimate for the R number is based on data from several weeks ago. Low case numbers and/or a high degree of variability in transmission across the region means these estimates are insufficiently robust to inform policy decisions.
